Exercise "SauceDemo" Page

This is a technical exercise that will evaluate your abilities when it comes to creating test cases and identifying points of enhancement on a platform. Please closely follow the instructions below and make sure to report any bug you may encounter.

Note: Please include all the information in your test cases that you deem necessary for clarity and understanding.

1. Go to the page https://www.saucedemo.com/
2. Create the amount of test cases for the login functionality that you think are necessary to validate it's working properly.
3. Login into the inventory page, this page was designed to include only clothing items. For each product on that page, only the name, description, price, and a button to add the product to the Shopping Cart should be displayed. When you click on the product's image a window should be opened showing the information of the product you clicked, and when you click on "Add to Cart" the shopping cart located on the top right corner should show the amount of items added to the cart. Please review the page and create test cases to validate all the information according to the acceptance criteria given.
4. Create all the required test cases to validate that the filters of the inventory page are working correctly.
